HCL-DOM-PADM-145

HCLSoftware Certified Professional Administrator -
Notes/Domino 14.5

ORDER FULL VERSION

<https://killexams.com/pass4sure/exam-detail/HCL-DOM-PADM-145>

Question: 1765

Incremental updates are designed to transfer only the changed components between versions instead of requiring a complete client installation package.

- A. False because incremental updates are supported only for server upgrades
- B. True because incremental updates reduce deployment size and network usage
- C. True because incremental updates require a full operating system reinstall
- D. False because incremental updates always reinstall the entire Notes client

Answer: B

Explanation: Incremental updates focus on delivering only modified files and components needed to bring a client to the desired version. This approach reduces bandwidth consumption, decreases deployment time, and minimizes disruption compared to distributing a complete installation package for every update cycle.

Question: 1766

A company wants to transition from traditional passwords to FIDO2 passkeys for accessing HCL Domino web applications. When discussing benefits over passwords with the executive board, which property should the administrator highlight as the primary defense against phishing attacks?

- A. Passkeys mirror the structural properties of the local ID Vault to automate internet password resets.
- B. Passkeys require manual activation via specific Domino server console commands every morning.
- C. Passkeys are cryptographically bound to the specific origin domain name of the web application, making them unusable on fraudulent clone sites.
- D. Passkeys utilize multi-character alpha strings that must be changed by the user every thirty days.

Answer: C

Explanation: FIDO2 passkeys provide strong protection against phishing because the WebAuthn protocol cryptographically binds the credential to the specific origin domain of the relying party web server. Even if a user is tricked into navigating to a malicious clone or phishing site, the authenticator will refuse to recognize the origin domain, and no credential assertion can be generated or leaked.

Question: 1767

A security engineer needs to verify that all communications between the local HCL Domino server's AI Gateway task and remote external AI Service Providers are fully protected from eavesdropping over the public internet. Which transport security rule must be strictly enforced within the connection profile configuration?

- A. Mandatory execution of all API calls over encrypted HTTPS channels using modern Transport Layer Security (TLS) protocol parameters.

- B. Verifying that the target endpoints bypass standard firewalls by utilizing port 1352 tunnels.
- C. Restricting all outbound communication traffic exclusively to unencrypted SMTP loops.
- D. Utilizing raw clear-text text payload structures to maximize server routing performance metrics.

Answer: A

Explanation: Prompts sent to external AI Service Providers can contain sensitive corporate text data. To prevent interception or exposure on the wire, the connection profiles within the AI Gateway must be configured to mandate encrypted HTTPS connections using modern, secure TLS protocol versions.

Question: 1768

An HCL Traveler administrator uses the Traveler Web Console to manage the enterprise mobile fleet. They notice a warning icon next to a critical cluster node indicating that the thread pool is exhausted. Which internal metric dashboard or status screen inside the Traveler Web Console should be analyzed to review active thread allocations and long-running ActiveSync transactions?

- A. The System Status component layout monitoring view.
- B. The Access Control List configuration viewport.
- C. The Device Security Policy override engine profile panel.
- D. The User Mailbox Quota validation matrix sheet.

Answer: A

Explanation: The Traveler Web Console features an interactive dashboard focused on real-time management. The System Status view provides administrators with an interactive visual summary of the server health, active sync allocations, operational parameters, and thread pool exhaustion metrics, enabling quick isolation of processing holdups.

Question: 1769

Which component stores the shared secret after QR code enrollment?

- A. Browser bookmark manager
- B. Authenticator application
- C. DNS server cache
- D. Network gateway

Answer: B

Explanation: The authenticator application securely stores the shared secret and uses it together with time calculations to generate TOTP codes.

Question: 1770

When using the AUT Notes install manifest file for Version Path configuration, what information is automatically filled in the Version Path document fields if the install manifest was imported correctly without errors?

- A. Fields marked with an asterisk (*) are filled from the install manifest file for the version being upgraded to
- B. All fields are automatically populated from the install manifest
- C. Only the to version and note fields are filled from the install manifest
- D. Only the upgrade from version field is filled from the install manifest

Answer: A

Explanation: When the install manifest file is imported correctly, the values of fields marked with an asterisk (*) in the Version Path document are filled automatically from the information in the install manifest file for the version being upgraded to. Fields without asterisks must be completed manually by the administrator.

Question: 1771

A system administrator needs to verify whether a user's client configuration parameters have successfully processed a newly established organization policy block. They open the local user's configuration space to find the hidden structural data record where applied policy information is cached. What is the name of this local profile element hidden within the mail database framework?

- A. The `$PolicyData` view or individual profile document records within the local configuration data cache
- B. The client registration history certificate note
- C. The central ID Vault authentication tracking index
- D. Policy application tracking log

Answer: A

Explanation: When Domino policies (such as desktop or registration setups) are evaluated by the client during authentication, the configuration engine caches these rules inside hidden profile structures and design elements (such as the `$PolicyData` note arrays) inside the local configuration files and local mail database replicas to govern interface execution properties offline.

Question: 1772

A junior technician asks a senior administrator about the core benefit of utilizing AdminP for user rename operations instead of manually editing the text strings inside every database document field. Which option accurately highlights an advantage of the AdminP lifecycle?

- A. It automatically converts all inbound database attachments into compressed clear-text logs.
- B. It completely eliminates the requirement to maintain active Person Documents in the directory.
- C. It moves all server processing threads off the local CPU and pushes them down to an unauthenticated cloud environment.
- D. It automates the cascading updates across all database ACLs, group indexes, and reader attributes throughout the domain, reducing human error and preserving data access continuity.

Answer: D

Explanation: The primary benefit of the Administration Process (AdminP) is automation. Manually updating an identity change across hundreds of document databases would be prone to error. AdminP handles this by tracking the rename lifecycle and pushing the updates across all server targets, maintaining consistent access permissions.

Question: 1773

Which deployment requirement is most directly associated with Traveler Integration?

- A. Mobile synchronization support
- B. Mail template inheritance
- C. Verse database replication
- D. OIDC token issuance

Answer: A

Explanation: Traveler Integration provides synchronization services for mobile devices, ensuring users can access current collaboration data while away from desktop systems.

Question: 1774

An administrator wants to track down an issue where an external AI Service Provider regularly drops connection requests from the Domino IQ environment during peak working hours. Which server statistic or diagnostic command should be used to isolate if the issue is a local network delay or an external service timeout?

- A. *showstatai* (or equivalent Domino IQ monitoring command strings)
- B. *tellhpreshTTLs*
- C. *upallnames.n - R*
- D. *tellrouterdkimshow*

Answer: A

Explanation: To monitor the performance and health of the AI subsystem, administrators can leverage dedicated server statistics or console commands, such as *showstatai*. This output details connection states, latency metrics, failed request codes, and transaction volumes for the configured AI Service Providers, helping isolate connection bottlenecks.

Question: 1775

Which feature is most directly associated with centralized control of desktop behavior in the Notes Client?

- A. Managed settings
- B. User bookmarks
- C. Workspace tabs
- D. Notes.ini comments

Answer: A

Explanation: Managed settings provide administrators with centralized control over desktop and application behavior across managed clients.

Question: 1776

For ECDSA certificates, what advantages are provided in Domino 14.5 ACME support? (Select All that Apply)

- A. Smaller key sizes with equivalent security
- B. Required for all Let's Encrypt certificates
- C. Faster handshake performance
- D. Modern curve options including NIST P-384

Answer: A,C,D

Explanation: ECDSA offers efficiency benefits. Multiple curves are supported. It is optional alongside RSA.

Question: 1777

An organization requires high security for web clients accessing HCL Verse on Domino 14.5. The security architect mandates that session tokens must be cryptographically bound to the user's browser session and must not be stored persistently on the disk. Which configuration combination in the Web SSO Configuration document (LTPA) should be deployed to meet this requirement?

- A. Set "Enable cookie expiration" to true and define an explicit idle timeout value.
- B. Set "Persistent Cookies" to Disabled and configure the "Secure" attribute flag to Enabled.
- C. Set the "Token Version" to LTPA_v3 and toggle the "Remember Me" policy off.
- D. Set the "Track Session Activity" parameter to Strict and enforce AES-256 token encryption.

Answer: B

Explanation: Disabling "Persistent Cookies" in the Web SSO Configuration document ensures that the generated LTPA session cookie is treated as a session-only cookie, causing the browser to discard it once closed and preventing it from being committed to persistent storage. Enabling the "Secure" flag further ensures the cookie is only transmitted over cryptographically secure HTTPS connections.

Question: 1778

In the passkey authentication workflow, after successful credential assertion, what does Domino do by default with signalAllAcceptedCredentials?

- A. Deletes all other credentials
- B. Logs out other sessions
- C. Updates the password field

D. Informs the authenticator of currently valid credentials for the site to clean up stale ones

Answer: D

Explanation: This WebAuthn Signal API synchronizes the authenticator by informing it of accepted credentials, allowing it to remove credentials no longer valid in passkey.nsf, improving security hygiene.

Question: 1779

An organization wants to configure a pay-as-you-go cloud file storage system to store their DAOS assets. During the setup phase, the administrator needs to evaluate the specific file extension that identifies a DAOS object container file. Which file extension is utilized exclusively by the DAOS object store engine?

- A. *.ntf*
- B. *.nlo*
- C. *.n*
- D. *.b* ☒

Answer: B

Explanation: The DAOS architecture uses a distinct file container system to isolate attachments. While standard databases use the *.n* extension and templates use *.ntf*, the extracted attachment objects managed by the DAOS repository are written with the *.nlo* extension.

Question: 1780

An administrator needs to understand the Traveler terminology for the process that removes data from mobile devices. What is the correct term for the process that remotely removes all Traveler data from a mobile device?

- A. Device remove action
- B. Device clear function
- C. Device wipe process
- D. Device purge operation

Answer: C

Explanation: Device wipe is the correct HCL Traveler terminology for the process that remotely removes all Traveler data from a mobile device. This process is used when mobile devices are lost, stolen, or when users leave the organization to protect sensitive organizational data by removing all mail, calendar, contacts, and tasks from the device.

Question: 1781

Which password reset methods are supported by Domino Password Reset Authority? (Select All that Apply)

- A. Self-service through web portal
- B. SMS text message verification
- C. Administrator-initiated reset via Console command
- D. Email-based reset link

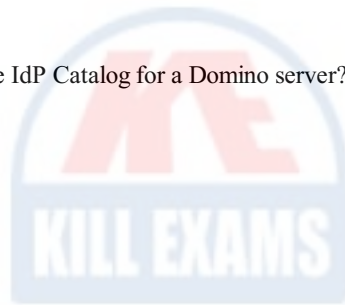

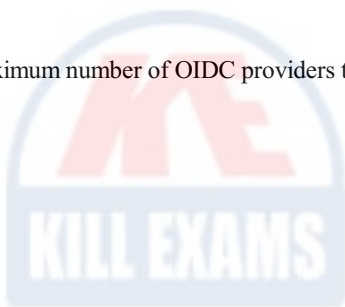

Answer: A,C,D

Explanation: Password Reset Authority supports email-based reset links, self-service through a web portal, and administrator-initiated resets using Console commands. SMS text message verification is not a native supported method in Domino Password Reset Authority without additional custom integration.

Question: 1782

What is the maximum number of OIDC providers that can be added in the IdP Catalog for a Domino server?

- A. 1
- B. 10
- C. 5
- D. Unlimited

Answer: C

Explanation: Up to five OIDC providers can be configured in the IdP Catalog (idpcat.nsf).

Question: 1783

Which Transport Layer Security features are enhanced in Domino 14.5? (Select All that Apply)

- A. Perfect Forward Secrecy with additional curves
- B. Mandatory TLS for all internal SMTP only
- C. Updated cipher suites with removal of weak options
- D. Support for TLS 1.3 where applicable

Answer: A,C,D

Explanation: Cipher updates remove insecure options. Modern TLS versions and PFS are supported. TLS is encouraged but configurable for internal/external.

Question: 1784

Common synchronization issue: User deleted from AD but still exists in Domino with "Disabled" status. DirSync cleanup schedule is weekly. What provisioning and synchronization lifecycle issues exist? (Select All that Apply)

- A. AD deletion event not logged in DirSync console
- B. Person document has Disable flag set instead of deletion
- C. User provisioning does not delete Domino users from AD
- D. DirSync deletion detection interval set to 7 days

Answer: A,B,D

Explanation: The stale disabled user issue occurs because DirSync deletion detection interval is set to 7 days (weekly cleanup schedule), Person document has Disable flag set instead of actual deletion (DirSync marks users as disabled rather than deleting), and AD deletion event is not logged in DirSync console (preventing cleanup trigger). User provisioning DOES delete Domino users when configured with deletion sync, but this requires explicit configuration.

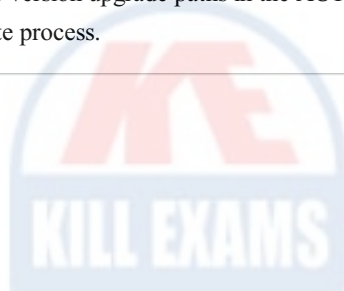

Question: 1785

Which statement best describes the purpose of a Version Map in AutoUpdate?

- A. It defines which installed versions map to which target upgrade versions
- B. It records server document replication failures
- C. It assigns ACL roles to administrator groups
- D. It stores user mail templates for roaming clients

Answer: A

Explanation: The Version Map is used to define version upgrade paths in the AUT Catalog. It helps determine how source versions should move to target versions during the update process.

Killexams.com is a leading online platform specializing in high-quality certification exam preparation. Offering a robust suite of tools, including Exam Questions, practice tests, and advanced test engines, Killexams.com empowers candidates to excel in their certification exams. Discover the key features that make Killexams.com the go-to choice for exam success.

Practice Exam Questions Based on Current Exam Objectives

Killexams.com provides practice exam questions aligned with the latest official exam objectives and latest syllabus. Our content is reviewed and updated regularly to reflect recent changes announced by certification vendors. By studying these practice questions, candidates will cover the structure, difficulty level, and topics of the actual exam, helping them prepare more effectively and efficiently.

Comprehensive Practice Exams (PDF Format)

Killexams.com offers multiple-choice questions (MCQs) in easy-to-read PDF format, covering all major domains of the exam. Each PDF contains a structured collection of practice questions and verified answers designed to support focused study. These MCQs help candidates reinforce key concepts, identify knowledge gaps, and improve exam readiness through consistent practice.

Realistic Practice Tests (Online Test Engine & Desktop Test Engine)

To support hands-on preparation, Killexams.com provides practice tests through both an Online Test Engine and a Desktop Test Engine. These tools are designed to simulate a real exam environment, allowing candidates to practice under exam-like conditions, with latest syllabus and topics of the exam. Performance tracking, test history, and result analysis help users evaluate their progress and focus on areas that need improvement.

Risk-Free Purchase Policy

Killexams.com follows a transparent and customer-friendly purchase policy. If users are not satisfied with the study materials, they may request assistance or a refund in accordance with our published terms and conditions. This policy reflects our commitment to customer satisfaction, fairness, and confidence in our preparation resources.

Regularly Updated Content

Our practice question bank is reviewed and updated on an ongoing basis to stay aligned with the latest exam outlines and vendor updates. This ensures candidates are studying up-to-date, relevant material, and preparing with content that reflects current exam expectations, helping them stay confident and well-prepared.
